

# Tips for Setting Up Your 10-foot Quilting Frame

## Use these five tips to make sure your frame is setup correctly and quilt-ready!

1. Make sure the legs are square with the table top (if the legs are at an angle, the poles will be slightly lower than normal).
2. Look closely at the carriage wheels and make sure they are centered and seated fully on the black tracks. If the tracks are too wide or too narrow, this will cause the carriage to be slightly raised.
3. Look closely at the machine wheels and see if the carriage track needs to be adjusted so the machine wheel are centered and fully seated on the carriage track.
4. If these are all good, a thin layer of tape can be applied to the ends and the center of the coupler poles so they fit a little tighter to limit the sagging of the pole.
5. Also keep in mind that once the quilt is on the frame and is tensioned, it will raise the pole slightly.

**IMPORTANT:** Making several small adjustments at a fraction of an inch, will make a big difference.

See your frame manual for complete setup information.
